# ***EXTRA THICK SIDING***

## *For a More Authentic Look.*

If you placed a home built from traditional milled logs next to a framed structure that has been finished with our extra thick siding, you'd be hard pressed to tell them apart. That's because our extra thick siding features an authentic log pattern that has been milled on full sawn 2x8 pine or cedar stock which has been hand selected for character. There are no wavy lines caused by thin material that bends; just the strong impression of two solid logs butting directly against each other. Individual courses of siding are joined by spline material which is provided and fits conveniently into slots milled into the siding.

Authentic log look. Includes spline material which connects pieces of siding and acts as a moisture barrier.

Solid log corners can be used to give an authentic butt and pass corner look to siding applications.
