

LAMINATED SIDING

For Top Performance...

As anyone familiar with wood will tell you, when a curved surface is milled onto an individual piece of wood, the same knots and grain structure that create the most attractive appearance can sometimes cause siding to bend and twist. To eliminate this problem, we now offer the same no warping, no twisting, no cracking characteristics found in our laminated logs in laminated siding. This is a heavy duty siding that looks just like our laminated logs. It adds thermal mass to standard insulated walls, and the extra wide horizontal surface makes it easy to hide fasteners.

Glued under more than one hundred pounds of pressure, laminations are locked into place to virtually eliminate bending and twisting.

This "log home" is actually a framed structure covered with Glu-Lam-Log's laminated siding.

Laminated false corners can be used to give an authentic butt and pass look to siding applications.
